In [1]:

```python
import pandas as pd

# 1. Load a sample dataset (we're using the 'sales' dataset from seaborn)
from seaborn import load_dataset
df = load_dataset('tips')

# 2. Clean data: Removing rows with missing values (if any)
df_cleaned = df.dropna()

# 3. Group data by 'day' and 'sex', then aggregate
result = (
    df_cleaned
    .pipe(lambda df: df.groupby(['day', 'sex'])['total_bill'].sum())  # Su
    .pipe(lambda grouped: grouped.reset_index())  # Reset index for better
)

# 4. Display the result
print(result)
```

```
    day     sex  total_bill
0  Thur    Male      561.44
1  Thur  Female      534.89
2   Fri    Male      198.57
3   Fri  Female      127.31
4   Sat    Male     1227.35
5   Sat  Female      551.05
6   Sun    Male     1269.46
7   Sun  Female      357.70
```
